A hard ring called the ocular sclerite surrounds the photoreceptors. Because of this compound structure, cockroaches see the world as a mosaic. Movable antennae, also known as antennal flagella, allow roaches to feel and smell the world around them. Although the antennae look like threads, they're really made of lots of tiny, hair-covered segments.

Although a number of muscles may be involved in an action, the principal muscle involved is called the prime mover, or agonist. To lift a cup, a muscle called the biceps brachii is actually the prime mover; however, because it can be assisted by the brachialis, the brachialis is called a synergist in this action (Figure 1). A synergist can also be a fixator that stabilizes the bone that is the ...

The human eye is a paired sense organ that reacts to light and allows vision. Rod and cone cells in the retina are photoreceptive cells which are able to detect visible light and convey this information to the brain. Eyes signal information which is used by the brain to elicit the perception of color, shape, depth, movement, and other features. The eye is part of the sensory nervous system.

Anatomy of the nasal mucosa. The nasal mucosa, also called respiratory mucosa, lines the entire nasal cavity, from the nostrils (the external openings of the respiratory system) to the pharynx (the uppermost section of the throat). The external skin of the nose connects to the nasal mucosa in the nasal vestibule. A dynamic layer of mucus overlies the nasal epithelium (the outermost layer of ...
